Manaras-Opera Standardizes the Disconnect Cut-Off Switch on OMJ

Responding to your needs, Manaras-Opera is announcing an improvement to the **OMJ** series of commercial door operators.

The **OMJ** series will now be supplied with a disconnect cut-off switch. The cut-off switch functions to disconnect the operator's 24V control as soon as the disconnect system is activated. During this time, open/close/radio/safety or other inputs will not energize the operator.

Features of the Disconnect Switch

- Avoids unintended operation of the operator when it is functioning in the disconnect or manual modes, thus decreasing the risk of injury to the end-user or maintenance personnel.
- Prevents the operator from operating after the disconnect switch is activated, therefore reducing the risk of unintended wear on the operator components and electrical consumption.

The phasing-in/out process was implemented at the end of September 2011.
For pricing or further information, please contact your Manaras-Opera sales representative.
